HTML and CSS Basics

Beginner Study Notes and Practice Guide

This short guide introduces core concepts and provides practice ideas. It is an original learning summary, not a substitute for a complete textbook.

HTML document

A standard HTML document contains a doctype, html element, head metadata, and a body containing visible page content.

Semantic HTML

Elements such as header, nav, main, section, article, and footer communicate the role of content.

Links and images

Use anchor elements for navigation and image elements with useful alt text for images.

CSS selectors

Selectors target elements by tag, class, or ID. Classes are reusable and commonly begin with a dot in CSS.

Box model

The CSS box model includes content, padding, border, and margin.

Flexbox and Grid

Flexbox is useful for arranging items along one axis; Grid is useful for two-dimensional layouts.

Responsive design

Media queries can change layout rules at different viewport widths.

Practice checklist

- Review the concepts and write a small example.
- Run your example and test an edge case.
- Explain the solution in your own words.
