Web Development Basics

Beginner Study Notes and Practice Guide

This short guide introduces core concepts and provides practice ideas. It is an original learning summary, not a substitute for a complete textbook.

How the web works

A browser requests a resource from a server using HTTP or HTTPS. The server returns a response that the browser displays or processes.

HTML

HTML gives a page its structure. Elements such as headings, paragraphs, links, images, and forms describe the content.

CSS

CSS controls presentation, including colors, spacing, layout, typography, and responsive behavior.

JavaScript

JavaScript adds behavior such as form validation, menus, dynamic updates, and interactions.

Frontend and backend

Frontend code runs in the browser. Backend code handles server-side logic, data access, authentication, and APIs.

Responsive design

Flexible layouts, relative units, and media queries help pages adapt to mobile, tablet, and desktop screens.

Practice

Create a profile page with a heading, image, navigation links, and a responsive two-column layout.

Practice checklist

- Review the concepts and write a small example.
- Run your example and test an edge case.
- Explain the solution in your own words.
